Chapter 1 – Project Aster Mining

It is year 2099 and Earth is running short of metals and mineral resources. Scientists all over the world have brainstormed an idea to do asteroid mining. NASA and ISRO have taken up the challenge to identify an Asteroid and also work together to build a spacecraft to land on the Asteroid for mining. This effort to mine the Asteroid was hence forth referred to as Project Aster-Mining!

Chapter 2 - Asteroid XA-CE1892

A very smart scientist in ISRO named Aditya Anirudh has found a time when an asteroid named asteroid XA-CE1892 will be very close to Earth. The project director Abhishek is going to be launching

2

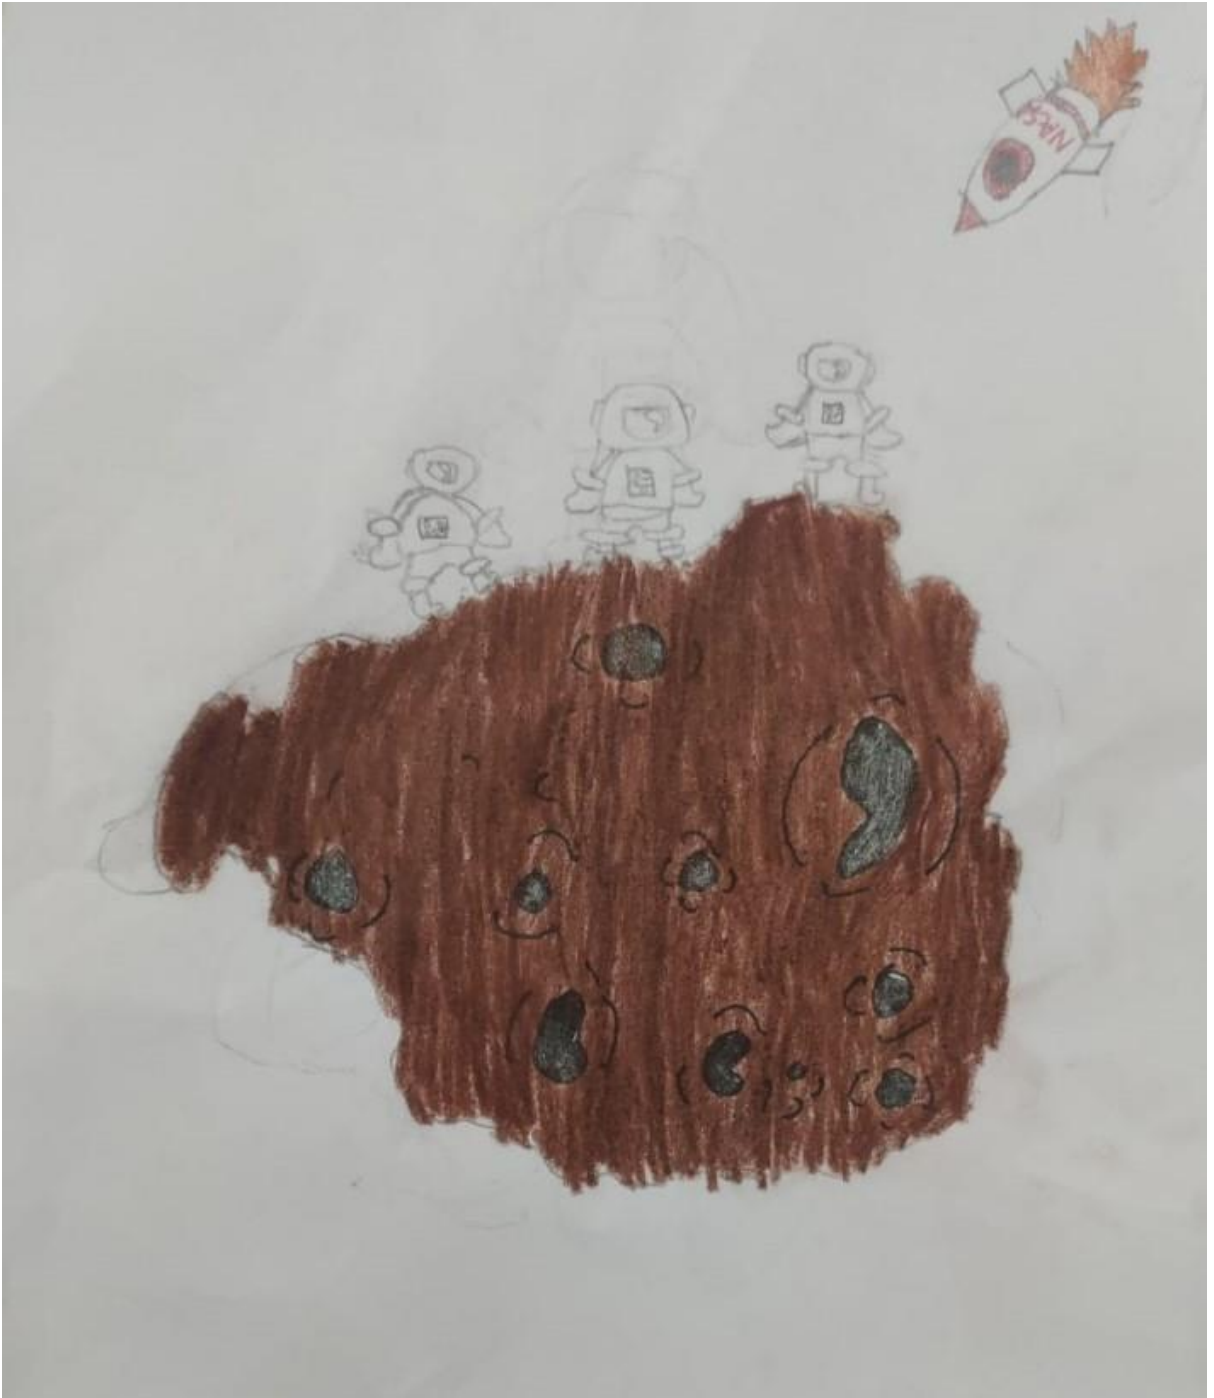

a spacecraft with a team of five astronauts for the purpose. A very experienced engineer named Sridhar has overlooked the production of this particular spacecraft. The lead tester named Nirupama has finished testing this spacecraft. After 3 long months the spacecraft is finally ready to go. Soon, the five astronauts boarded the spacecraft (with food and water) and the spacecraft was launched and it reached space.

3

Chapter 3 – Finale

After 5 months of travel they reached the asteroid and landed. They started mining on the asteroids surface. They kept mining but the surface was too hard! They needed more astronauts to come and help them. They sent a message to NASA and ISRO. NASA decided to send five astronauts to help. In five months time the five astronauts came with more supplies and helped them.

4

After a fortnight they finished mining and were ready to return. In another five months the astronauts returned to Earth with many resources. ISRO and NASA gave the resources to their respective governments and the governments distributed some resources to every country. It is 2100 and Earth is no longer short of resources.

Blurb

It is year 2099 and Earth is running short of metals and mineral resources.

NASA and ISRO team up to perform asteroid mining on Asteroid XA-CE1892.

Will they succeed?
